BYT Team work 2026/2027

Group nr: 20c

Group name: The winners

1. Gazi Ataol [C] s34024
2. Yryskeldi Omuraliev s29039
3. Nikita Antonovitch s31402
4. Nazar Martyniuk s30822

1. System Name

Clinic Scheduling System

2. Client and Users

The system is commissioned by a medical clinic to improve the organization and management of patient appointments.

The main users of the system will be:

- **Receptionists** – register patients, schedule and reschedule appointments, manage cancellations, and check doctors' availability.
- **Doctors** – view their schedules, check information about their appointments, and manage their availability.
- **Patients** – view available appointment times, book or cancel appointments, and receive information about upcoming visits.
- **Clinic Manager/Administrator** – manage doctors, services, schedules, and user access.

3. Problem and Goal

Currently, appointments may be managed using phone calls, emails, paper records, or separate calendars. This can make scheduling time-consuming and may result in double bookings, missed appointments, or difficulty finding suitable appointment times.

Receptionists need to spend considerable time checking doctors' availability and communicating with patients. Patients may also have difficulty finding available appointments without contacting the clinic directly.

The goal of the system is to provide one central place for managing clinic appointments and schedules. The system should make booking and managing appointments faster and more organized, while giving doctors, receptionists, and patients clear information about schedules and available times.

4. Expected Functionality

Users should be able to:

- Create and manage patient records.
- Register doctors and their medical specialties.
- Define the medical services offered by the clinic.
- Create and manage doctors' working schedules.
- View available appointment times.
- Book appointments for patients.
- Allow patients to request or book appointments.
- Reschedule appointments when necessary.
- Cancel appointments.
- View daily and weekly appointment schedules.
- Prevent two patients from being booked for the same time with the same doctor.
- Search for patients, doctors, and appointments.
- View upcoming and previous appointments.
- Send reminders about upcoming appointments.
- Allow doctors to mark their availability or unavailability.
- Allow clinic administrators to manage users and basic clinic information.
- Provide information about cancelled and missed appointments.

5. Data Processed

The system should store information about:

- Patients, including their name, contact information, and basic identification details.
- Doctors, including their name, specialty, contact information, and working hours.
- Medical services offered by the clinic.
- Appointment dates and times.
- Appointment status, such as scheduled, completed, cancelled, or missed.
- The doctor assigned to each appointment.
- The patient assigned to each appointment.
- Information about doctors' availability and unavailability.
- Appointment reminders and notifications.

Patient information may be entered by receptionists or by patients themselves when creating an account. Doctors or clinic administrators will provide information about doctors' schedules and availability. Appointment information will be entered when an appointment is created or changed.

Patients should only be able to view their own appointments and relevant personal information. Doctors should be able to view their schedules and the information necessary for their appointments. Receptionists should be able to manage appointments and patient information required for their work. Administrators should have broader access to manage the clinic's users, services, and schedules.

6. Additional Expectations and Constraints

The system should be simple and easy to use because it will be used by both clinic employees and patients with different levels of technical experience.

The system should be accessible from computers and mobile devices so that patients can manage appointments conveniently and clinic staff can access schedules when needed.

Patient information must be protected and only accessible to authorized users. The system should provide different levels of access depending on the user's role.

The system should support multiple doctors and patients and allow several appointments to be managed at the same time.

The clinic may also want the system to send appointment reminders to reduce the number of missed appointments.

The exact number of doctors and patients, detailed access permissions, reminder methods, and any connection with existing clinic systems will be clarified during the initial interview with the client.
